Profile

Backend and AI-integrated web developer with a strong focus on web application security — manually testing every endpoint I ship using Burp Suite, OWASP ZAP, and SQLMap before it goes live. Building production web apps through Chingu's Agile developer program, from LLM-driven data pipelines to React frontends. Active open-source contributor, including a merged security fix in a 3.8k-star security-automation platform.

Experience

Web Developer, *Chingu (Agile Developer Program)* 02/2026 – Present
Remote

- Collaborative software teams built around 7-week Agile/Scrum "Voyages"
- Work in cross-functional, distributed teams following Scrum ceremonies (standups, sprint planning, retros) to ship a full-stack web app within each 7-week voyage.

Chingu Voyage 60, Tier 3 — CramerBot

- Built CramerBot, an AI-powered trading dashboard that ingests real-time posts from a financial commentator, processes them through an LLM pipeline, and converts the output into structured trading signals for paper and live trading.
- Contributed to the Supabase/PostgreSQL data layer (Alembic migrations, Dockerised local Postgres, upsert-based ingestion) used to persist scraped posts, AI-generated signals, and user configurations without duplication.
- Since the app executes real trades, ran manual security testing across all API endpoints — probing authentication, authorization, and input handling — before features were merged to production.

Chingu Voyage 61, Tier 3 — Wordle-ish

- Built Wordle-ish, a Wordle-style word game, using React 19, Vite, and Tailwind CSS, with Supabase (Postgres, Auth, Row Level Security) powering GitHub OAuth sign-in, a per-mode leaderboard, and word-selection via RPCs.
- Performed security testing against the app's Supabase RPC endpoints and legacy Node/Express word API using Burp Suite, OWASP ZAP, and SQLMap, checking for injection, broken access control, and auth-bypass issues.
- Worked within a GitHub Actions CI pipeline enforcing lint and build checks on every pull request.

Backend Developer / Technical Support, *Benin Electrics (BEDC)* 01/2022 – 01/2026
Edo, Nigeria

- Maintained and supported backend services for BEDC's customer-facing application, scaling to serve customer accounts across the BEDC franchise — growing from roughly 255,000 at the start of the role to 325,000 by its end.
- Provided internal technical support for app installation across the organisation, troubleshooting deployment and access issues for staff and customer-facing teams.
- Designed and delivered technical training programs for non-technical staff, translating app and backend concepts into practical, usable guidance to raise internal digital literacy.

- Ran manual security testing (Burp Suite, OWASP ZAP) across all API endpoints ahead of each release, identifying and remediating [N] vulnerabilities before they reached production.

Education

Bachelor of Engineering (Mechanical), *University of Benin, Edo* 2017

Skills & Competencies

Languages & Frameworks
- Python, JavaScript/TypeScript
- React, REST & RPC-based APIs
- Linux, Unix, C

Security & Tools
- Burp Suite (manual pentesting)
- OWASP ZAP
- SQLMap
- OWASP Top 10 / secure coding

AI & Data
- LLM/AI pipeline integration
- PostgreSQL, Supabase, Redis

DevOps & Workflow
- Agile/Scrum, Git, CI/CD (GitHub Actions)
- Docker

OPEN SOURCE CONTRIBUTIONS

TracecatHQ/tracecat
- Found and fixed a session-cookie security flaw (CWE-614) in this open-source security-automation platform (3.8k+ GitHub stars): the auth cookie's Secure flag was derived from the internal API URL instead of the public-facing HTTPS URL, so it could be transmitted over plaintext HTTP.
- Shipped the fix with regression tests covering both HTTP and HTTPS cases; reviewed and merged into main by a project maintainer, who credited the find directly.

cytham/nanovar
- Diagnosed a crash in this structural-variant caller for long-read sequencing data, triggered when BAM/CRAM files (e.g. from certain PacBio HiFi pipelines) lacked an expected alignment-score tag.
- Implemented a fallback alignment-score calculation from CIGAR/NM tag data approximating the aligner's own scoring scheme, and verified it against synthetic BAM test cases covering missing-tag edge cases (pull request open, pending maintainer review).
