Hostinger Chatbots Team (Kodee)
Kaunas / Vilnius, Lithuania

Dear Hostinger Chatbots Team,

Re: Application for Mid Python Engineer

I am applying for the Mid Python Engineer role. I am a Python backend developer with about four years of production experience — and AI/LLM integration is my strongest differentiator. That combination maps directly to what you are building with Kodee.

I have built an LLM pipeline end to end. At Chingu (Voyage 60, CramerBot), I designed and built a data pipeline that ingests real-time financial posts and converts them into structured trading signals through prompt-based LLM processing, persisting them for paper and live trading. That meant ingestion, prompt design, structured-output handling, and a PostgreSQL layer (Alembic migrations, Dockerised Postgres, upsert ingestion) — the same shape of work as expanding an AI assistant and integrating it with support workflows.

Production Python at volume. At Benin Electrics (BEDC), I maintained a customer-facing payments/billing backend that grew to 325,000 accounts — API design, database work, and release management on a high-throughput system. I ship Dockerised services with CI/CD (GitHub Actions) and know how to keep REST APIs fast and reliable under load.

I work the way your team works. I am productive with AI-assisted development tools and genuinely curious about where this field is going. My Python experience spans REST and async services with SQLAlchemy/Alembic; picking up FastAPI or Django for your stack is a quick step, not a leap.

I am fully remote from Nigeria, flexible with schedules, and would love to help you make Kodee faster and smarter for Hostinger's customers.

Best regards,

John Ezekiel
